# **Installation Instructions**

## Contents

Section	1	Safe guard instruction	. 2
Section	2	Introduction of Triangle Bracket Mounting System	.3
Section	3	Installation Instructions	.6
Section	4	Precautions	. 2
Section	5	Daily maintenance1	. 3

## Section 1

1. Safe guard instruction

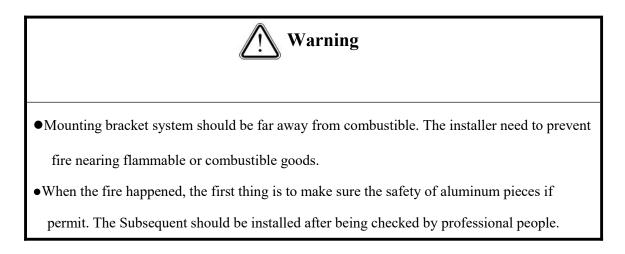

1.1、 Construction prohibited at following environment:

1.1.1 Construction prohibited when more than five strong winds occurred in the process of open work.

 $1.1.2\,{\scriptstyle \mbox{\sc n}}$  Construction prohibited under the weather of rain, heavy snow, fog, sandstorm and severe weather.

1.1.3 Construction prohibited under bad lighting in the night.

### 1.2 Guard against fire

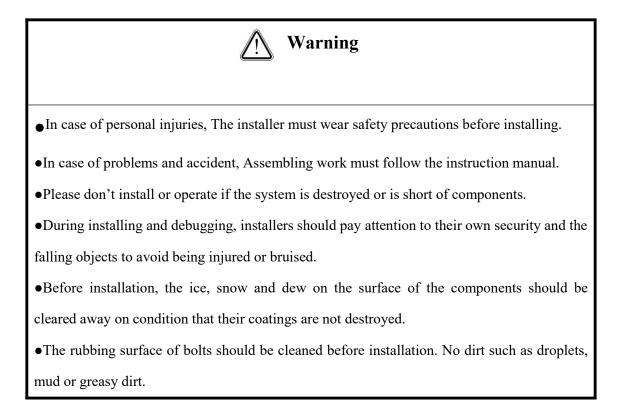

## 1.3、Guard against damage

## 1.4. Other matters need attentions

Please pay attention to the following matters to prevent from any accident, injury, etc:

#### 1.4.1 Transport and installation

## Section 2

#### 2.1 Introduction of Triangle Bracket Mounting System

Product name and type

Product name: Modularized East-West System

Can be installed Panel thickness:

Use Frame: 30/35mm;

Fig.	Description
	Ballast Board × <b>8</b>
	Inner Clamp Kit 30/35mm <b>×8</b>
	End Clamp Kit 30/35mm × <b>8</b>

## 2.2. Structure Components (Picture is only for reference)

## 2.3 Effect drawing

# Section 3

The installation of Fixed Ground Mounting System

## **3.1** Pre-installation chapter

		Make sure the goods are in good conditions
•	Check the goods	after they arrive. Then check the amount of goods
		according to the shipping list.
		Please read the instructions carefully before
•		installing, to make sure the installation and
	Read the installation instruction	debugging are conducted in order.
		Warning: please install according to our
		instruction. Or else your peril.
•	Make sure the installers and crane are	Make sure the installers and crane are ready
	ready to install.	to install.

	Warning: the installer must wear safety
	equipment (such as safety helmet and shoes).
	Heavy objects should be elevated at a stable
	speed in order to avoid the dangers caused by their
	swing due to the drastic change of speed. Also they
	should be declined in a low speed to avoid being
	destroyed when falling on the ground.
	Marning: any stay or passing under the armed
	levers of crane of any person is forbidden.
	Material should be placed according to
	batches and sorts before they have place assigned.
<ul> <li>Unloading and storage</li> </ul>	The material which cannot be immediately used
	should be stacked in order and covered by plastic
	cloth.
	Components cannot be placed on the ground
	directly. They should be placed on the support with
	a height of 200mm above the ground. The distance
	between the support and the ground should be
	determined on the basis that it will not cause
	residual deformation of the components.

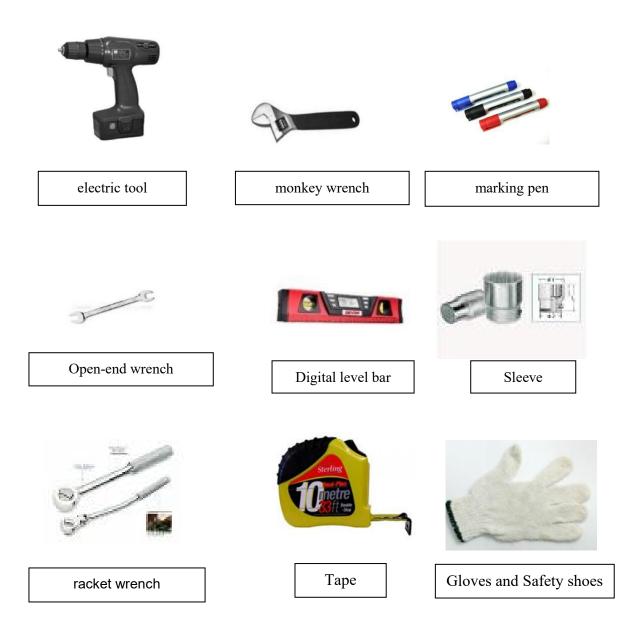

## 3.2 Schedule for the required amount of the mechanical equipment and tools for installation

#### 3.2.1 Mechanical equipment

Crane

Fork lift

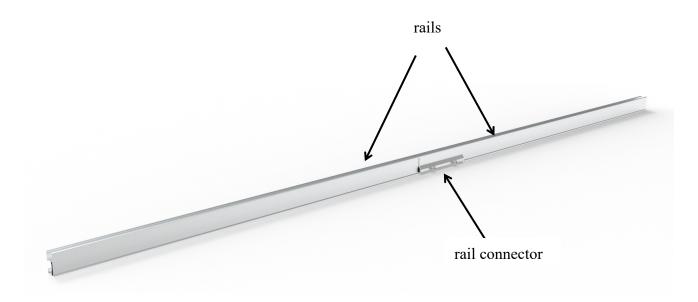

#### 3.2.2 Installation Tools

### 3.3 Installation Steps

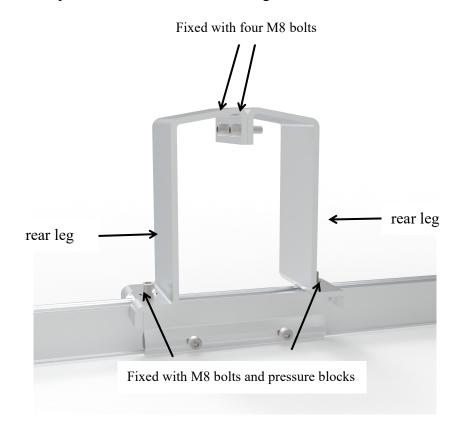

#### 3.3.1 Installation of rails

Remove the two 1250 long rails and align them, then lock them with the rail connectors and two M8 bolts.

#### 3.3.2、Installation of Rear leg

Fit the two rear legs back to back on the center of the two rails and secure them to the rails with two M8 bolts and two pressure blocks. The two rear legs are secured with four M8 bolts.

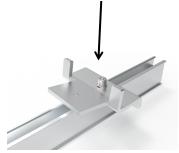

#### 3.3.3 Installation of Front leg

Place the two front legs at suitable positions on both ends of the rail and fix them with two M8 bolts with pressure blocks (do not lock the front leg bolts first).

Front leg 1 Fixed with M8 bolts and pressure blocks, not locking

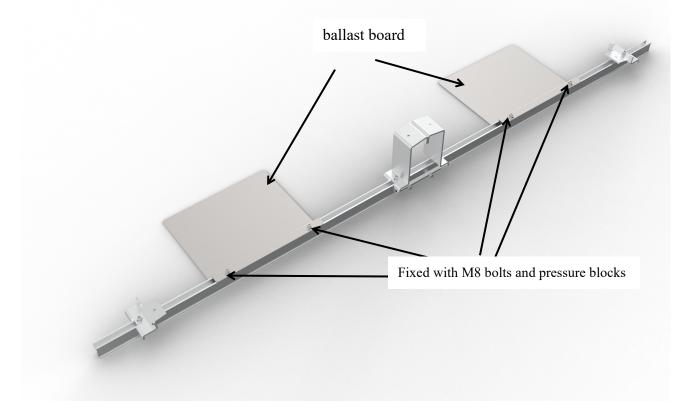

Front leg 2 Fixed with M8 bolts and pressure blocks, not locking

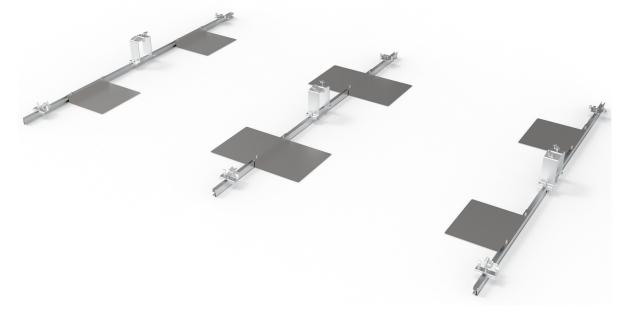

#### 3.3.4 Installation of Ballast Board

Attach the two ballast boards to the center of each of the two rails and secure them to the rails with two M8 bolts and pressure blocks.

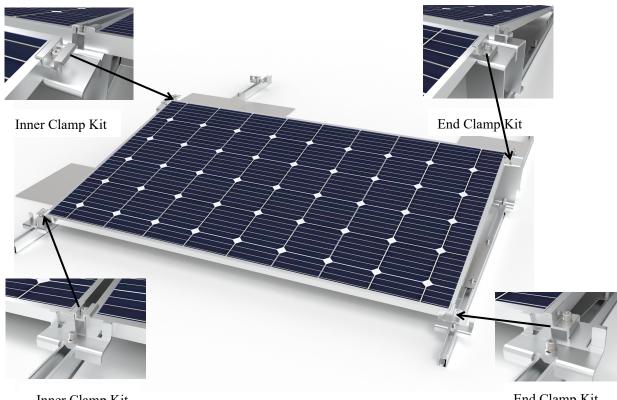

#### 3.3.5 Schematic diagram of completed bracket installation

Note: The total number of ballast board for the center rail is four.

#### 3.3.6 Installation of components

Fix the Inner Clamp Kits and End Clamp Kits on the front and rear legs with M8 bolts and pressure blocks, and lock the bolts on the front legs after determining the position of the front legs. (Make sure that the left and right plates are installed at the same time when installing the Inner Clamp Kits)

Inner Clamp Kit

End Clamp Kit

SS304 (A2-70) Recommended Bolt Torque Table		
Bolt Specifications	Recommended torque value (N.M)	
M8	8-10	

## Section 4

#### Precautions

### 4.1 Notes on engineering installation dimensions

Where the specific dimensions involved in the installation of the project are subject to the project construction drawings. The installation instructions are only for the purpose of explaining the installation method of the product.

### 4.2 Precautions for the installation of stainless steel fasteners

Due to the good ductility of stainless steel, and carbon steel has an essential difference; improper use will lead to bolts and nuts can not be rotated after matching. That is, "locking" commonly known as "bite". Prevention of locking mainly in the following areas:

### 4.2.1 Reduce the coefficient of friction:

(1) Ensure that the threaded surface is clean (e.g., no gray sand, debris);

(2) It is recommended to apply water wax on the surface or add lubricant (such as grease, 40# machine oil) during installation;

### 4.2.2. Correct operation method:

(1) It must be screwed perpendicular to the axis of the threads, do not tilt;

(2) In the process of screwing, the force applied must be even, and the screwing torque must not exceed the specified safe torque value;

(3) Use torque wrenches or socket wrenches as much as possible, and avoid the use of movable wrenches or electric wrenches; use electric wrenches and also try to reduce the speed.

(4) Avoid using it under high temperature, and do not rotate it quickly when using it, so as to avoid the locking caused by the rapid rise of temperature; (e.g. using electric wrenches, etc.)

### 4.3, Final process of assembly

It needs to check the condition of all the components and parts after finishing assemble of fixed mounting system:

- Checking if there are damage
- > Checking if there are something forget to assemble
- > Checking if all the bolts locked tightly
- > Checking if all the modules assembled accordance
- Cleaning project site after assembling.

### M Warning: It needs to check structure condition of mounting system before wiring.

- > Please don't climb, when mounting system assembling work finished.
- Before construction of Junction box and other electric equipements which will be installed in mounting system must be confirmed by technical people.

## Section 5

#### Daily maintenance

Maintenance instruction		Maintenance part	
	Maintenance of connected bolts		
	Checking every bolt junctions once a y	ear, tightening if the junction is loosening
